

Diagnostic Ultrasound

- Ultrasound imaging is a noninvasive medical test that helps your primary care provider diagnose and treat medical conditions. Ultrasonography is an ultrasound-based diagnostic medical imaging technique used to visualize muscles, tendons, and many internal organs, to capture their size, structure and any pathological lesions with real time tomographic images. Ultrasound has been used to image the human body for at least 50 years and has become one of the most widely used diagnostic tools in modern medicine. Diagnostic ultrasounds are offered at our Starbright location.
